

Concussion Program

A concussion is an injury that occurs from a blow to the head, face or neck. The force is then transferred to the brain and may temporarily alter one's mental or physical abilities. Some individuals lose consciousness in the event of a concussion, some do not. Symptoms may appear immediately, or occur in the days following an injury.

At St. Francis, our goal is to provide comprehensive care to individuals who have experienced a concussion or have concussion-related symptoms by addressing physical and cognitive symptoms. Our team provides services to both adult and pediatric patients and can also make appropriate referrals to more specialized providers, if necessary.

Our concussion program combines an integrative team of health care professionals, including physical therapists, occupational therapists, speech-language pathologists and athletic trainers to address symptoms such as headaches, dizziness, cognitive deficits, and vision changes, among others.

ImPACT baseline or post-testing, consultations and evaluations are offered by appointment.
